1. Introduction

This document details the cases where the VAT3 Webservice sends invalid HTTP error codes. These are 4xx/5xx error codes in Rest.

There can be several cases where these error codes are sent:

1. Schema error
2. Valid schema but bad request
3. Authorisation error
4. Server fault

The error response structure for all four cases is shown below. The response can have one or more error objects.

An error object has the following fields:

1. **Description:** a short description of the error message.
2. **Code:** Validation code for the error.

2. Example Errors

2.1. Schema Error

Problem with Request: Missing 'startdate' field

Response Code: 400

```
